This report describes the results of the closed-loop, on engine test of the Bendix EH-K1 digital controller on Build 5 of the Advanced Technology Engine Gas Generator (ATEGG). Control modes are described with emphasis on changes to be incorporated on ATEGG Build 6. The control mode changes include simplification of the fuel governor structure, modification of the fuel splitter logic to aid main fuel system light-off, and modification of the fuel limiting logic to prevent transient overshoots of critical engine parameters. Off-engine testing of the controller with the ATEGG fuel system is discussed. Fuel system characteristics were analyzed and adjusted to yield tighter control of engine fuel flow. The Build 5 test stand set-up and instrumentation are described, along with testing accomplished and data correlation. The open loop operation of the controller was successfully demonstrated, and data correlation with test stand values was satisfactory. Successful closed loop digital control operation was exercised at the end of Build 5 engine testing. (Author)

Investigation of Convergent-Divergent Nozzles Applicable to Reduced-Power Supersonic Cruise Aircraft.
B. L. Berrier, and R. J. Re. Dec 80, 218p NASA-TP-1766, L-13974

An investigation was conducted of isolated convergent-divergent nozzles to determine the effect of several design parameters on nozzle performance. Tests were conducted using high pressure air for propulsion simulation at Mach numbers from 0.60 to 2.86 at an angle of attack of 0 deg and at nozzle pressure ratios from jet off to 46.0. Three power settings (dry, partial afterburning, and maximum afterburning), three nozzle lengths, and nozzle expansion ratios from 1.22 to 2.24 were investigated. In addition, the effects of nozzle throat radius and a cusp in the external boattail geometry were studied. The results of this study indicate that, for nozzles operating near design conditions, increasing nozzle length increases nozzle thrust-minus-drag performance. Nozzle throat radius and an external boattail cusp had negligible effects on nozzle drag or internal performance.

Supersonic Stall Flutter of High Speed Fans.
J. J. Adamczyk, W. Stevens, and R. Jutras. 1981, 15p NASA-TM-81613, E-612

Proposed for Presentation at 26TH Ann. Intern. Gas Turbine Conf., Houston, 8-12 Mar. 1981; Sponsored by AM. Soc. Of Mechan. Engr.

An analytical model is developed for predicting the onset of supersonic stall bending flutter in axial flow compressors. The analysis is based on a modified two dimensional, compressible, unsteady actuator disk theory. It is applied to a rotor blade row by considering a cascade of airfoils whose geometry and dynamic response coincide with those of a rotor blade element at 85 percent of the span height (measured from the hub). The rotor blades are assumed to be unshrouded (i.e., free standing) and to vibrate in their first flexural mode. The effects of shock waves and flow separation are included in the model through quasi-steady, empirical, rotor total-pressure-loss and deviation-angle correlations. The actuator disk model predicts the unsteady aerodynamic force acting on the cascade blading as a function of the steady flow field entering the cascade and the geometry and dynamic response of the cascade. Calculations show that the present model predicts the existence of a bending flutter mode at supersonic inlet Mach numbers. This flutter mode is suppressed by increasing the reduced frequency of the system or by reducing the steady state aerodynamic loading on the cascade. The validity of the model for predicting flutter is demonstrated by correlating the measured flutter boundary of a high speed fan stage with its predicted boundary. This correlation uses a level of damping for the blade row (i.e., the log decrement of the rotor system) that is estimated from the experimental flutter data. The predicted flutter boundary is shown to be in good agreement with the measured boundary.

Solution of Plane Cascade Flow Using Improved Surface Singularity Methods.

Presented for Presentation at 26TH Ann. Intern. Gas Turbine Conf., Houston 8-12 Mar. 1981; Sponsored by AM. Soc. Of Mech. Engr.

A solution method was developed for calculating compressible inviscid flow through a linear cascade of arbitrary blade shapes. The method uses advanced surface singularity formulations which were adapted from those in current external flow analyses. The resulting solution technique provides a fast flexible calculation for flows through turbomachinery blade rows. The solution method and some examples of the method's capabilities are presented.

Full Potential Solution of Transonic Quasi-3-D Flow Through a Cascade Using Artificial Compressability.

Presented at 26TH Ann. Intern. Gas Turbine Conf., Houston, Tex., 8-12 Mar. 1981; Sponsored by Asme.

The three-dimensional flow in a turbomachinery blade row was approximated by correcting for streamtube convergence and radius change in the throughflow direction. The method is a fully conservative solution of the full potential equation incorporating the finite volume technique on body fitted periodic mesh, with an artificial density imposed in the transonic region to insure stability and the capture of shock waves. Comparison of results for several supercritical blades shows good agreement with their hodograph solutions. Other calculations for these profiles as well as standard NACA blade sections indicate that this is a useful scheme analyzing both the design and off-design performance of turbomachinery blading.

Flight Evaluation of a Simplified Gross Thrust Calculation Technique Using an F100 Turbofan Engine in an F-15 Airplane.
F. J. Kurtenbach, and F. W. Burcham, Jr.. Jan 81, 21p NASA-TP-1782, H-1118

A simplified gross thrust calculation technique was evaluated in flight tests on an F-15 aircraft using prototype F100-PW-100 engines. The technique relies on afterburner duct pressure measurements and empirical corrections to an ideal one-dimensional analysis to determine thrust. In-flight gross thrust calculated by the simplified method is compared to gross thrust calculated by the engine manufacturer's gas generator model. The evaluation was conducted at Mach numbers from 0.6 to 1.5 and at altitudes from 6000 meters to 13,700 meters. The flight evaluation shows that the simplified gross thrust method and the gas generator method agreed within plus or minus 3 percent. The discrepancies between the data generally fell within an uncertainty band derived from instrumentation errors and recording system resolution.

Using nonlinear digital simulation as a representative model of the dynamic operation of the QCSEE turbofan engine, a feedback control system is designed by variable frequency design techniques. Transfer functions are generated for each of five power level settings covering the range of operation from approach power to full throttle (62.5% to 100% full power). These transfer functions are then used by an interactive control system design synthesis program to provide a closed loop feedback control using the multivariable Nyquist array and extensions to multivariable Bode diagrams and Nichols charts.

Contract NAS3-20646

A full scale, full annular diffuser/combustor model test rig was tested to investigate how configurational changes affect pressure loss and flow separation characteristics. The rig was characterized by five major modules: inlet; prediffuser; strut; simulated combustor; and full combustor. The prediffuser featured a short, curved wall dump design. Performance goals included: (1) a separation-free prediffuser flow field; (2) total pressure loss limited to 3.0 percent in the prediffuser and shrouds; and (3) an overall section pressure loss of 5.5 percent P sub T3 at the design airflow distribution. The results indicated that the prediffuser configurations operate well within the program goals for pressure loss and demonstrate separation free operation over a wide range of inlet conditions.

A digital computer simulation model for the J85-13/Planar Pressure Pulse Generator (P3 G) test installation was developed by modifying an existing General Electric compression system model. This modification included the incorporation of a novel method for describing the unsteady blade lift force. This approach significantly enhanced the capability of the model to handle unsteady flows. In addition, the frequency response characteristics of the J85-13/P3G test installation were analyzed in support of selecting instrumentation locations to avoid standing wave nodes within the test apparatus and thus, low signal levels. The feasibility of employing explicit analytical expression for surge prediction was also studied.

The stability of the fan and the compressor components was examined individually using linearized and time dependent, one dimensional stability analysis techniques. The stability of the fan core integrated compression system was investigated using a two dimensional compression system model. The analytical equations on which this model was based satisfied the mass, axial momentum, radial momentum, and energy conservation equations for flow through a finite control volume. The results gave an accurate simulation of the flow through the compression system. The speed lines of the components were reproduced; the points of instability were accurately predicted; the locations where the instability was initiated in the fan and the core were indicated; and the variation of the bypass ratio during flow throttling was calculated. The validity of the analytical techniques was then established by comparing these results with test data and with results obtained from the steady state cycle deck.

The materials technologies studied included thermal barrier coatings for turbine airfoils, turbine disks, cases, turbine vanes and engine and nacelle composite materials. The cost/benefit of each technology was determined in terms of Relative Value defined as change in return on investment times probability of success divided by development cost. A recommended final ranking of technologies was based primarily on consideration of Relative Values with secondary consideration given to changes in other economic parameters. Technologies showing the most promising cost/benefits were thermal barrier coated temperature nacelle/engine system composites.

Prepared for 19TH Aerospace Sci. Meeting, St. Louis, 12-15 Jan. 1981; Sponsored by Aiaa.

A finite difference procedure was used to compute the mixing for three experimentally tested mixer geometries. Good agreement was obtained between analysis and experiment when the mechanisms responsible for secondary flow generation were properly modeled. Vorticity generation due to flow turning and vorticity generated within the centerbody lobe passage were found to be important. Results are presented for two different temperature ratios between fan and core streams and for two different free stream turbulence levels. It was concluded that the dominant mechanisms in turbofan mixers is associated with the secondary flows arising within the lobe region and their development within the mixing section.

Analysis of Pressure Spectra Measurements in a Ducted Combustion System.
Ph.D. Thesis - Toledo Univ.
J. H. Miles. Nov 80, 138p NASA-TM-81583, E-558

Combustion noise propagation in an operating ducted liquid fuel combustion system is studied in relation to the development of combustion noise prediction and suppression techniques. The presence of combustor emissions in the duct is proposed as the primary mechanism producing the attenuation and dispersion of combustion noise propagating in an operating liquid fuel combustion system. First, a complex mathematical model for calculating attenuation and dispersion taking into account mass transfer, heat transfer, and viscosity effects due to the presence of liquid fuel droplets or solid soot particles is discussed. Next, a simpler single parameter model for calculating pressure auto-spectra and cross-spectra which takes into account dispersion and attenuation due to heat transfer between solid soot particles and air is developed. Then, auto-spectra and cross-spectra obtained from internal pressure measurements in a combustion system consisting of a J-47 combustor can, a spool piece, and a long duct are presented. Last, analytical results obtained with the single parameter model are compared with the experimental measurements. The single parameter model results are shown to be in excellent agreement with the measurements.

Several methods for determining acoustic mode structure in aircraft turbofan engines using wall microphone data were studied. A method for reducing data was devised and implemented which makes the definition of discrete coherent sound fields measured in the presence of engine speed fluctuation more accurate. For the analytical methods, algorithms were developed to define the dominant circumferential modes from full and partial circumferential arrays of microphones. Axial arrays were explored to define mode structure as a function of cutoff ratio, and the use of data taken at several constant speeds was also evaluated in an attempt to reduce instrumentation requirements. Sensitivities of the various methods to microphone density, array size and measurement error were evaluated and results of these studies showed these new methods to be impractical. The data reduction method used to reduce the effects of engine speed variation consisted of an electronic circuit which windowed the data so that signal enhancement could occur only when the speed was within a narrow range.

Presented at Automotive Technol. Develop. Contractor Coordination Meeting, Dearborn, Mich., 11-13 Nov. 1980.

A four working space, double acting piston, Stirling engine simulation was developed for controls studies. Two simulations, one for detailed fluid behavior, and a second model with simple fluid behavior but containing the four working space aspects and engine inertias, validate these models separately, then upgrade the four working space model by incorporating the detailed fluid behavior model for all four working spaces. The single working space model contains the detailed fluid dynamics. The four working space (FWS) model was built to observe the behavior of the whole engine. The drive dynamics and vehicle inertia effects are simulated. The capabilities of the model are exercised to look at working fluid supply transients, short circuit transients, and piston ring leakage effects.

The report describes how much excess fuel that is consumed by cars when starting from cold, and how the fuel consumption is influenced by the use of an electric engine heater before start. Tests have been made with two cars in temperatures between -18C and +3C. On the basis of the results some recommendations are given concerning heating-time in different ambient temperatures. Finally some calculations are made of the balance between fuel savings and costs for electric energy, from both a private economy and a national economy point of view.

One hundred twenty-seven tests were conducted over a chamber pressure range of 125-1500 psia, a fuel temperature range of -245 F to 158 F, and a fuel velocity range of 48-707 ft/sec to demonstrate the advantages and limitations of using high speed photography to identify potential combustion anomalies such as pops, fuel freezing, reactive stream separation and carbon formations. Combustion evaluation criteria were developed to guide selection of the fuels, injector elements, and operating conditions for testing. Separate criteria were developed for fuel and injector element selection and evaluation. The photographic test results indicated conclusively that injector element type and design directly influence carbon formation. Unlike spray fan, impingement elements reduce carbon formation because they induce a relatively rapid near zone fuel vaporization rate. Coherent jet impingement elements, on the other hand, exhibit increased carbon formation.

Results of an investigation to determine the full scale drag coefficient in the high speed, low density regime of the Viking lander capsule 1 entry vehicle are presented. The principal flight data used in the study were from onboard pressure, mass spectrometer, and accelerometer instrumentation. The hypersonic continuum flow drag coefficient was unambiguously obtained from pressure and accelerometer data; the free molecule flow drag coefficient was indirectly estimated from accelerometer and mass spectrometer data; the slip flow drag coefficient variation was obtained from an appropriate scaling of existing experimental sphere data. Comparison of the flight derived drag hypersonic continuum flow regime except for Reynolds numbers from 1000 to 100,000, for which an unaccountable difference between flight and ground test data of about 8% existed. The flight derived drag coefficients in the free molecule flow regime were considerably larger than those previously calculated with classical theory. The general character of the previously determined temperature profile was not changed appreciably by the results of this investigation; however, a slightly more symmetrical temperature variation at the highest altitudes was obtained.

Both first and second stage environments are defined for all base heating DFI locations and design body points of interest. As expected, STS-1 nominal environments are generally less severe than those determined for the high loft and low loft dispersed trajectory conditions. The reduction in cold wall heating with the nominal trajectory varies for each base location analyzed, but, in general, was approximately twenty percent.

Preliminary Design Trade-Offs for a Multi-Mission Stored Cryogen Cooler.
Final rept.,
A. Sherman. Dec 78, 102p NASA-CR-160072, LMSC-D630389
Contract NAS5-24287

Preliminary design studies were performed for a multi-mission solid cryogen cooler having a wide range of application for both the shuttle sortie and free flyer missions. This multi-mission cooler (MMC) is designed to be utilized with various solid cryogens to meet a wide range of instrument cooling from 10 K (with solid hydrogen) to 90 K. The baseline cooler utilizes two stages of solid cryogen and incorporates an optional, higher temperature third stage which is cooled by either a passive radiator or a thermoelectric cooler. The MMC has an interface which can accommodate a wide variety of instrument configurations. A shrink fit adapter is incorporated which allows a drop-in instrument integration. The baseline design provides cooling of approximately 1 watt over a 60 to 100 K temperature range and about 0.5 watts from 15 to 60 K for a one year lifetime. For low cooling loads and with use of the optional radiator shield, cooling lifetimes as great as 8 years are predicted.

Development of Assembly and Joint Concepts for Erectable Space Structures.
Final rept.,

Contract NAS1-15240

The technology associated with the on-orbit assembly of tetrahedral truss platforms erected of graphite epoxy tapered columns is examined. Associated with the assembly process is the design and fabrication of nine member node joints. Two such joints demonstrating somewhat different technology were designed and fabricated. Two methods of automatic assembly using the node designs were investigated, and the time of assembly of tetrahedral truss structures up to 1 square km in size was estimated. The effect of column and node joint packaging on the Space Shuttle cargo bay is examined. A brief discussion is included of operating cost considerations and the selection of energy sources. Consideration was given to the design assembly machines from 5 m to 20 m. The smaller machines, mounted on the Space Shuttle, are deployable and restowable. They provide a means of demonstrating the capabilities of the concept and of erecting small specialized platforms on relatively short notice.

Models for Propagation of NORAD Element Sets.
Spacetrack rept. no. 3,
Felix R. Hoots, and Ronald L. Roehrich. Dec 80, 104p

General perturbations element sets generated by NORAD can be used to predict position and velocity or Earth-orbiting objects. To do this one must be careful to use a prediction method which is compatible with the way in which the elements were generated. Equations for five compatible models are given here along with corresponding FORTRAN IV computer code. With this information a user will be able to make satellite predictions which are completely compatible with NORAD predictions. (Author)

Contract NAS5-24300

Forty three orbits, which are periodic in geocentric reference frames rotating at lunar and at solar rates were found using a patched conic technique. The different orbits provide coverage of different parts of the distant geomagnetic tail. The parameters for 43 sun synchronous double lunar swingby orbits and plots of the sun synchronous double lunar swingby orbits are included.

The sensor's operation principle, the simulation procedure, the mathematical modelling and the computer program are explained. The test results for a 900 km altitude circular and polar orbit are presented. The results show that the sign and magnitude of the sensor errors vary with satellite position and season. The maximum errors in pitch and roll are 0.06 and 0.03 degrees for the edge scanner sensor. The pitch error for a 2 deg field of view (FOV) analogue sensor is 0.12 deg. The size of the FOV affects the energy balance sensor but not the edge scanner sensor.

Procurement decisions regarding Department of Defense satellite systems are usually based upon the assumption of a reliable and dependable launch system. Attempts to relate disruptions of launch operations to numbers of satellites on-orbit are often in the form of discrete-event simulations (requiring significant numbers of data inputs and large amounts of computer time). (The approach which is adopted in this study is a form of continuous simulation (as opposed to discrete-event simulation), an approach which has traditionally been limited to analysis of systems in the physical sciences. The continuous simulation methodology requires significantly fewer inputs than discrete-event simulations and is amenable to being implemented on a programmable, hand-held calculator, saving expensive computer and data-gathering time. Several examples are provided which demonstrate how continuous simulation may be used to model disruptions in launch capability and various satellite operational philosophies. (Author)

KEYWORD INDEX

NTIS®

Index entries in this section are selected to indicate important ideas and concepts presented in a report. When using the keyword index, be sure to look under terms narrower, broader, or related to a particular topic. Although some of the keywords are not selected from a controlled vocabulary of terms, most of them have been selected from the DoD, DoE, NASA, or NTIS controlled vocabularies. The entries are arranged by keyword and then by the NTIS order number.

CORPORATE AUTHOR INDEX

NTIS

In this index, the name of the company, university, or government agency that performed the research or prepared the report is listed. Entries are arranged first by the organization's name, then alphanumerically by the performing organization report or series number. If no report or series number is included, the subarrangement is by NTIS order number.

CONTRACT/GRANT NUMBER INDEX

NTIS®

Entries in this index list reports produced as a result of research done under specific contract or grant numbers. Entries are arranged first, alphanumerically, by the contract or grant number, and then by the corporate or performing organization.

NTIS ORDER/REPORT NUMBER INDEX

NTIS®

Entries in this index list the NTIS order number, the performing organization report number, and the sponsoring organization report number, each in its own alphanumeric position. Although reports may be ordered using only the performing organization report number or the sponsoring organization report number, please use the NTIS order number to order items available from NTIS to ensure faster service. It is best to check the full bibliographic citation in the Reports Announcements section before ordering. Entries are arranged alphanumerically.

Rethinking US Security Policy for the 1980s. Proceedings of the Annual National Security Affairs Conference (7th) held 21-23 July 1980, Fort McNair, Washington, DC.
AD-A093 865/4 2138 PC **A15**/MF **A01**

11
Ballistic Evaluation of Engine Compartment Grilles for Armored Personnel Carrier, M113
AD-315 125/5 2262 MF **A01**

25
Tracing Water Movement by Means of Escherichia Coli Bacteriophages,
PB81-150708 2174 PC **A04**/MF **A01**

29
Phosphorus and Organic Matter Discharged by Finnish Rivers to the Baltic Sea (Suomen Jokivesien Itaemereen Kuljettama Fosfori ja Orgaaninen Aine),
PB81-150575 2193 PC **A03**/MF **A01**

36-77-III
An Evaluation of the Dichotomies within Federal Cash Management of Grant Programs,
PB81-148462 2129 PC **A08**/MF **A01**

70NED4
Investigation of Acoustic Emission from Simulated Reactor Primary Piping under Dynamic Stress Testing.
AD-906 185/4 2250 PC **A02**/MF **A01**

80-1
Development of a Tabletop Model for the Generation of Amorphous/Microcrystalline Metal Powders.
AD-A093 645/0 2246 PC **A08**/MF **A01**

80-03-12
Reprint: Research and Practice in Office Automation.
AD-A093 594/0 2140 PC **A02**/MF **A01**

80-11-09
Constructing Superviews.
AD-A093 678/7 2204 PC **A03**/MF **A01**

80-27
Criteria for Assessment of Potential Hazards to Welders Health,
PB81-152605 2180 PC **A03**/MF **A01**

80-28
Assaying Potential Carcinogenicity of Welding Fume and Hexavalent Chromium with the Mammalian Spot Test,
PB81-152597 2180 PC **A02**/MF **A01**

80-49
Summary of IIW Documents (1978-1979) from the Danish Welding Institute,
PB81-152589 2180 PC **A02**/MF **A01**

80/66N-227
TRACALS Evaluation Report. Solid State Instrument Landing System Initial Evaluation Report, AN/GRN-29 Runway 16, McClellan AFB, California, 9-25 September 1980.
AD-A093 968/6 2264 PC **A03**/MF **A01**

80/66N-228
TRACALS Evaluation Report. Solid State Instrument Landing System Initial Evaluation Report, AN/GRN-29 Runway 34, McClellan AFB, California 9-25 September 1980.
AD-A094 005/6 2264 PC **A03**/MF **A01**

80/66N-237
TRACALS Evaluation Report. Solid State Instrument Landing System, AN/GRN-29(V) Runway 15 Initial Evaluation Report, Maxwell AFB, Alabama, 12-22 November 1980.
AD-A094 016/3 2264 PC **A04**/MF **A01**

80/66R-224
TRACALS Evaluation Report. Precision Approach Radar, AN/FPN-62, Initial Evaluation Report, Pease AFB, New Hampshire, 10-15 October 1980.
AD-A093 956/1 2264 PC **A02**/MF **A01**

80/66R-232
TRACALS Evaluation Report. Airport Surveillance and Precision Approach Radar AN/GPN-24 Initial Evaluation Report, Dobbins AFB, Georgia, 3-19 September 1980.
AD-A093 936/3 2263 PC **A04**/MF **A01**

80/66R-233
TRACALS Evaluation Report. Gapfiller Radar AN/GPN-25 Initial Evaluation Report, Tolicha Peak, Nevada, 9 June - 7 July 1980 and 25-30 August 1980.

80SRC47
Advanced Target Tracker Concepts.
AD-A094 008/0 2264 PC **A05**/MF **A01**

172
Reprint: Efficiency of Conversion of Kinetic Energy to Potential Energy by a Breaking Internal Gravity Wave.
AD-A093 475/2 2190 PC **A02**/MF **A01**

502F
Comment Reduire les Pertes de Billes et de Sciages Dues Aux Insectes Perce-Bois (How to Reduce the Loss of Timber and Sawing Due to Wood Boring Insects),
PB81-150666 2121 PC **A02**/MF **A01**

512FR
Appret de Produits de Bois au Moyen de Systemes a Base D'Eau (Wood Products Treatment by Means of a Water System),
PB81-150757 2216 PC **A02**/MF **A01**

514FR
Rubans Anti-Fentes Pour Placages Verts (Green Veneer Reeling Type),
PB81-150542 2225 PC **A02**/MF **A01**

979-79-VI
A Study and Evaluation of Restructuring of Farmers Home Administration's Field Offices with Primary Emphasis on Coordination between the District Offices and Substate Planning Districts.
PB81-154510 2130 PC **A04**/MF **A01**

1634-8019
Rapid Acquisition of Spread Spectrum Signals.
AD-A093 800/1 2256 PC **A09**/MF **A01**

09601-6036-T0-00
Transformation Theory for the Compressible Turbulent Boundary Layer with Arbitrary Pressure Gradient.
AD-848 843/9 2285 PC **A03**/MF **A01**

017999
Relationship of Underkeel Clearance and Vessel Speed to Grounding,
AD-A093 535/3 2249 PC **A02**/MF **A01**

60485A
Candidate Industrial Preparedness Program.
AD-A093 624/5 2256 PC **A05**/MF **A01**

623152
Evaluation of Three Demonstration Parking Facilities in California.
PB81-154940 2246 PC **A04**/MF **A01**

624175
Rigid Pipe Proof Testing Under Excess Overfills with Varying Backfill Parameters. Section III (Part I). Determination of Internal Forces in the Pipe and Pipe Deformations, R/C Pipe.
PB81-153728 2241 PC **A12**/MF **A01**

A-8338
Experimental Aerodynamic Characteristics of Two V/STOL Fighter/Attack Aircraft Configurations at Mach Numbers from 0.4 to 1.4.
N81-14981/7 2119 PC **A23**/MF **A01**

AAI-76-96R
Hedonic Indices as a Measure of Housing Quality,
PB81-151755 2145 PC **A15**/MF **A01**

AAI-78-67
Mobility in the Housing Allowance Demand Experiment,
PB81-151771 2145 PC **A12**/MF **A01**

AAI-78-105
The Demand for Rental Housing: Evidence from a Percent of Rent Housing Allowance,
PB81-151730 2145 PC **A15**/MF **A01**

AAI-79-8
Economic and Racial/Ethnic Concentration in the Housing Allowance Demand Experiment,
PB81-151748 2145 PC **A08**/MF **A01**

AAI-79-16
Minimum Standards Requirements in the Housing Allowance Demand Experiment,
PB81-151763 2145 PC **A06**/MF **A01**

AAI-79-41
Housing Consumption Under a Constrained Income Transfer: Evidence from a Housing Gap Housing Allowance,
PB81-151797 2146 PC **A22**/MF **A01**

AAI-79-111
Housing Allowances and Other Rental Housing Assistance Programs-A Comparison Based on the Housing Allowance Demand Experiment, Part 2: Costs and Efficiency,
PB81-151813 2146 PC **A16**/MF **A01**

AAI-79-120
Participation Under Alternative Housing Allowance Programs: Evidence from the Housing Allowance Demand Experiment,
PB81-151805 2146 PC **A19**/MF **A01**

AAI-79-132
Housing Allowances and Other Rental Housing Assistance Programs-A Comparison Based on the Housing Allowance Demand Experiment, Part 1: Participation, Housing Consumption, Location, and Satisfaction,
PB81-151979 2147 PC **A19**/MF **A01**

AAI-79-141
The Estimated Effects of the Work Equity Project on Welfare Caseload. Executive Summary,
PB81-151466 2145 PC **A03**/MF **A01**

AAI-80-62
Evaluation of the Community Economic Development Program: Long-Term Evaluation and Final Report,
PB81-151854 2146 PC **A09**/MF **A01**

AC-DRL-TR68-47
Mechanical Characteristics of Fluid-Ejecting Models.
AD-846 491/9 2285 PC **A03**/MF **A01**

AC-DRL-TR68-59
Analysis of Errors in the Reduction of Interferometric Data.
AD-846 765/6 2287 PC **A03**/MF **A01**

AD-A093 445/5
Stability of Linear Forms in Independent Random Variables in Banach Spaces.
AD-A093 445/5 2226 PC **A02**/MF **A01**

AD-A093 446/3
Manufacturing Technology Program for Microwave Components.
AD-A093 446/3 2246 PC **A16**/MF **A01**

AD-A093 447/1
Cryogenic Preservation of Monocytes from Human Blood and Plateletpheresis Cellular Residues.
AD-A093 447/1 2155 PC **A03**/MF **A01**

AD-A093 448/9
Analytic Determination of Interference Thresholds for Microwave Landing System Equipment and TACAN/DME Equipment.
AD-A093 448/9 2262 PC **A07**/MF **A01**

AD-A093 449/7
MLS Channel Assignment Model.
AD-A093 449/7 2262 PC **A06**/MF **A01**

AD-A093 450/5
An Ultrasensitive Electron (Soft X-Ray) Silver Halide/Chalcogenide Negative or Positive Inorganic Resist.
AD-A093 450/5 2255 PC **A03**/MF **A01**

AD-A093 451/3
Dislocation Concepts in Friction and Wear.
AD-A093 451/3 2284 PC **A06**/MF **A01**

AD-A093 452/1
Application of Short-Crested Wave Theory in the Design of Three Dimensional Coastal Hydrodynamic Models.
AD-A093 452/1 2190 PC **A03**/MF **A01**

AD-A093 453/9
Investigating the Effects of Low Temperature Annealing of Amorphous Corrosion Resistant Alloys.
AD-A093 453/9 2219 PC **A04**/MF **A01**

AD-A093 454/7
Liquid Metal Embrittlement of Amorphous Alloys.
AD-A093 454/7 2220 PC **A03**/MF **A01**

AD-A093 455/4
High Frequency Asymptotics and the Transition Matrix Formulation of Scattering,
AD-A093 455/4 2283 PC **A03**/MF **A01**

Foreign NTIS Representatives

NTIS is represented in many countries around the world by local organizations. These representatives ensure NTIS clients in those countries of fast and efficient service when transacting business with NTIS. They offer the convenience of accepting payment in local currencies and any order-related problem can also be resolved by them. These representatives may also serve as an additional channel for non-U.S. information acquisitions.

NTIS clients in the countries listed below should direct all orders and inquiries to these representatives.
